MINCE: Matching INstructions Using Combinational Equivalence for Extensible Processor

Newton Cheung, Sri Parameswaran, Jörg Henkel, Jeremy Chan

February 2004 Proceedings of the conference on Design, automation and test in **Europe - Volume 2 DATE '04**

Publisher: IEEE Computer Society

Full text available: pdf(254.00 KB) Additional Information: full citation, abstract, citings, index terms

Designing custom-extensible instructions for Extensible Processors1 is a computationally complex task because of the large design space. The task of automatically matching candidate instructions in an application (e.g. written in a high-level language) to a predesigned library of extensible instructions is especially challenging. Previous approaches have focused on identifying extensible instructions (e.g. through profiling), synthesizing extensible instructions, estimating expected performance ...

2 Symbolic simulation and verification: Hardware verification using ANSI-C programs

as a reference

Edmund Clarke, Daniel Kroening

January 2003 Proceedings of the 2003 conference on Asia South Pacific design automation ASPDAC

Publisher: ACM Press

Full text available: pdf(80.74 KB)

Additional Information: full citation, abstract, references, citings

We describe an algorithm to verify a hardware design given in Verilog using an ANSI-C program as a specification. We use SAT based Bounded Model Checking [1] in order to reduce the equivalence problem to a bit vector logic decision problem. As a case study, we describe experimental results on a hardware and a software implementation of the data encryption standard (DES) algorithm.

RTL-Datapath Verification using Integer Linear Programming

Raik Brinkmann, Rolf Drechsler

January 2002 Proceedings of the 2002 conference on Asia South Pacific design automation/VLSI Design ASP-DAC '02

Publisher: IEEE Computer Society

Full text available: pdf(174.19 KB) Publisher Site

Additional Information: full citation, abstract, citings

Satisfiability of complex word-level formulas often arises as a problem in formal verification of hardware designs described at the register transfer level (RTL). Even though most designs are described in a hardware description language (HDL), like Verilog or VHDL, usually this problem is solved in the Boolean domain, using Boolean solvers. These engines often show a poor performance for data path verification. Instead of
